HOW TO USE THIS GUIDE

Read it once end to end — it's short by design. Then treat Module 03 and the Batching Protocol as your working reference: keep them open during your weekly session instead of re-reading from the top each time.

Algorithm Dominion

Every platform tells you what it's rewarding right now — most creators never learn to read the signal.

This module is how you find your territory before you publish a single piece.

Signal-first, not trend-first

Trends are lagging indicators — by the time you see one, the algorithm has already started rotating away from it. Signals are leading indicators: rising completion rates on a format, rising share velocity on a topic, rising audio adoption in your niche. Chase signals, not trends.

The 3-source scan

Run this before every batch session: (1) your own last 10 posts, sorted by retention — not views; (2) the top 15 posts in your niche this week, sorted by engagement rate, not raw views; (3) the "suggested for you" feed on a fresh scroll session, logged out. Cross-reference all three for repeating hooks, formats, and pacing.

Territory claiming

Pick one narrow angle inside your niche that you can own for 30 days straight. Broad niches lose to narrow ones — the algorithm needs a clean signal about what to show your content next to, and "a bit of everything" gives it nothing to work with.

Hook Mastery

You have roughly 1.5 seconds before a viewer's thumb decides your fate. This module is the full hook system — not luck, a repeatable formula set organized by the emotion it triggers.

The 5 hook families

Every hook that works reduces to one of five emotional triggers: curiosity gap, controversy/contrarian take, fear/loss aversion, aspiration/status, and humor/absurdity. Rotate across all five — repeating one family burns out your audience's response to it within 2–3 weeks.

Formula bank — sample set (full 250-hook vault in Premium & Exclusive)

Curiosity: “Nobody’s talking about the [thing] that actually [outcome]” · “The [number] second mistake costing you [loss]”. Contrarian: “Everyone says [belief]. Here’s why that’s backwards.” · “Stop doing [popular advice] — do this instead”. Fear/loss: “If you’re doing [common action], you’re losing [thing]” · “The change nobody warned you about”. Aspiration: “How I went from [low state] to [high state] in [timeframe]” · “What the top 1% of [niche] do differently”. Humor/absurd: “POV: you just found out [absurd juxtaposition]” · cold-open a visual punchline before any words land.

Delivery matters as much as wording

Say the hook line in the first frame — not after a logo, not after a throat-clear intro. Text-on-screen should mirror the spoken hook within the first second, not lag behind it.

AI Content Factory

The batching workflow that turns one 45-minute session into 5–10 finished pieces. This is the system — not a single prompt, a full production line.

Step 1 — Angle brief (5 min)

For each piece, write one sentence: the claim, the audience, the emotion. “For [audience], [claim], which makes them feel [emotion].” This single sentence is your steering input for every downstream step — skipping it produces generic output.

Step 2 — Script scaffold (10 min)

Hook (1–2 lines) → Setup (why this matters, 2–3 lines) → Payoff (the actual value, 4–6 lines) → CTA (soft, one line). Draft all 5–10 scaffolds before writing full scripts for any single one — batching the scaffold step keeps your hook variety high.

Step 3 — Full script pass (20 min)

Expand each scaffold to full spoken script. Read it out loud once — if you stumble on a sentence, your viewer will lose the thread there too. Cut, don't polish.

Step 4 — Shot list (10 min)

One line per shot: what's on screen, how long it holds, what text overlay (if any). This step is what separates "batched" from "rushed" — it's the difference between filming with intent and filming blind.

Native Format Rituals

The same idea, formatted three different ways, performs three different amounts. This module is the platform-specific cheat sheet.

TikTok

Native shot on phone, visible imperfection > polish. Captions on by default — most watch muted. Ideal length for cold-start growth: 21–34 seconds. Post density beats post polish in the first 30 days.

Instagram Reels

Higher production tolerance than TikTok — but the hook rule doesn't relax. Reels rewards saves and shares more than TikTok does; end every piece with a reason to save (a list, a reference, a “come back to this” line).

X (Twitter)

Native video autoplays muted in-feed — your first 3 seconds must work with zero audio and zero context. Pair video posts with a text hook in the post body, not just the video's on-screen text.

Cross-posting rule

Never post the exact same export to all three. Re-edit the first 2 seconds and the caption for each platform's native behavior — this alone recovers a meaningful chunk of the reach lost to “watermarked repost” penalties.

Retention Alchemy

A view that leaves at second 4 is worth nothing. This module is the structural pattern that keeps a viewer through to the last frame — and triggers the share reflex on the way out.

The open loop

Reference the payoff in the hook without giving it away: “the third one changed how I post completely”. The viewer stays to close the loop you opened.

Pattern interrupts every 3–4 seconds

A cut, a zoom, a text pop, a tone shift. Static shots longer than 4 seconds are where retention graphs fall off a cliff — check your own retention chart to confirm this on your content specifically.

The share trigger

People share content that makes them look smart, funny, or in-the-know to send it to someone specific. End with a line that names who this is “for” — it gives the viewer a reason and a recipient in the same beat.

Batching Protocol

One focused session, a full week covered. This is the weekly schedule that keeps the loop running without burning you out.

The weekly block

Monday: 45–60 min batch session (Modules 2 + 3) → produces the week's 5–7 pieces. Tuesday–Sunday: 10–15 min/day for posting, captions, and signal-check — not filming, not scripting.

Why batching beats daily grinding

Creative decision fatigue compounds across a day the same way it compounds across a week. One high-focus session produces sharper hooks than seven scattered 20-minute sessions — you're not re-loading context each time.

The buffer rule

Always keep 2 pieces in reserve past the current week. It removes the panic-post pattern that's responsible for most low-effort, low-performing content on any account.

Signal Reading

Stop guessing. This is the analytics framework that tells you exactly what's working — fast enough to act on it inside the same week.

The scorecard

Track four numbers per post, not twelve: 3-second retention %, completion rate, share rate, and comment rate. Views are a lagging vanity number — these four predict what the algorithm will do with your next post.

The weekly review (15 min, same time every week)

Sort last week's posts by completion rate. Identify the top 2 — what hook family, what format, what topic? Identify the bottom 2 — where exactly did retention drop? Fix one variable at a time next week so you know what moved the number.

Kill criteria

If a format underperforms your account average twice in a row, retire it for at least 3 weeks before revisiting. Sunk cost is the single biggest reason creators keep producing content that isn't working.

Monetization God Mode

An audience without a monetization path is a hobby. This module plugs your growing audience into the highest-leverage revenue paths without spending the trust you've built.

The offer ladder

Free content (trust) → low-ticket digital product (\$10–40, solves one specific problem) → mid-ticket offer (\$100–400, solves a broader problem) → high-ticket or recurring (services, coaching, community). Most creators try to sell the top rung to an audience that's only met the first.

Native monetization stacking

Run platform creator programs and affiliate placements underneath your own offer, not instead of it — they're supplemental, not a strategy on their own.

The trust tax

Every promotional post spends trust; every genuinely useful post earns it back. Keep a visible ratio in your batching plan (a rough 4:1 value-to-offer split holds up well) so you're never withdrawing faster than you're depositing.

Your 7-day content calendar

The exact weekly rhythm from Module 06, laid out day by day. Pin this — it's the schedule, not just the theory.

DAY	FOCUS
Mon	Batch session — script + shot-list 5 pieces (Module 3)
Tue	Film + post piece 1 · 10-min signal check on last week
Wed	Post piece 2 · light engagement pass (reply to comments)
Thu	Post piece 3 · scout 3-source scan for next week's angles
Fri	Post piece 4 · flag top performer for a follow-up piece
Sat	Post piece 5 (or reserve buffer piece) · lighter engagement day
Sun	Rest / no new filming · queue Monday's batch inputs

RULE OF THUMB

If Monday's batch session gets skipped, the whole week's schedule shifts — don't try to catch up mid-week by rushing scripts. Push the whole week back a day instead.

Monthly platform teardown

Each month we pull three posts that broke out in creator niches similar to yours, and break down exactly what made them work: hook family, pacing, format choice, and the specific structural beat where retention held. You get the framework applied to real examples, not just the theory.

What the higher tiers unlock

You've got the full Premium system above — everything you need to run the loop. If you want to go further, here's exactly what upgrading adds. No surprises, no repackaged content.

- EXCLUSIVE** All future modules & updates — forever, no expiry
- EXCLUSIVE** Quarterly live strategy sessions (recorded & searchable)
- EXCLUSIVE** Private async feedback channel — 1:1 content critique
- EXCLUSIVE** First access to all new tools and playbooks

UPGRADING

Log back in at monkeygod.xyz and the higher tiers are priced with your Premium purchase in mind — check the pricing page for current upgrade terms.

— START TODAY

One loop. One hour. Run it tomorrow morning.

You don't need the perfect setup or a bigger following to start — the Premium system is built for cold starts. Run the 3-source scan, batch your first 5 pieces, and post the first one within 48 hours of reading this.
